Best Reviews Most Recent Best Reviews - By Rum Feb-14/2019 17:14:07 Hello Rum, Thank you for your request. Yes, that's fine. Triangular, color-changing LED light panels that you can control on your Android or iOS device, or using voice commands: This is the field for Nanoleaf Aurora, one of the most design-oriented devices for a connected home we've ever seen. This is not your typical smart home gadget. This does not promise to make your life more comfortable or your home more comfortable. It's not even a very practical light source. Instead, Nanoleaf Aurora is a design play for connected living space. He wants your smart home to express itself. And you know what? It's all normal. People buy beautiful things to hang on their walls all the time - so why not a beautiful smart light installation? View all the photos No.11 More at \$200 (about 165 pounds/AUS\$260), the nine-panel Nanoleaf Aurora starter kit is not cheap. But it's not outrageously expensive, either, especially when you consider how eye-popping these panels are - or that cost about as much as you'd pay for a three-lamp Philips Hue starter kit. Like those Philips Hue lamps, the Aurora panels work with Apple HomeKit, smart home standards built into iPhone and iPad that work with the latest iOS software. HomeKit lets you switch lights and devices directly from your phone's control center or Siri voice commands, and the Aurora panels do an outstanding job to make it all work. Compatibility with Amazon's Alexa is coming to the end of this year, too, so you'll soon have a second voice control tool. All of this adds up to an advanced in-house experience for out-and-out and proud smart home enthusiasts. You don't need these things on your walls - no one does - but it's hard to deny that they make a pretty compelling case in support of the novelty of smart lighting. Zoom in on the image, modalTemplate:content, setContentOnInit:false'gt; Tyler Lizenby/CNET Future, which we were promised If you're a fan of classic science fiction, or if you just watched a lot of cartoons as a child, then maybe these things look familiar. Color-changing light panels have been the backbone of artificial futuristic pop culture for decades, illuminating countless spaceships, alien bases and dwellings of tomorrow. Nanoliph thinks it's time for these panels to light up your living room, too. And why not? They look amazing, thanks to a design that relies on modular build, geometric simplicity and bold, bright colors, all of which combine to offer a wide range of display options. Zoom in on the image, you can connect any side of the Aurora panel to any other Aurora panel with these connector chips. Tyler Lizenby / CNET You can connect any panel to any panels using an SD card as a connector chip join their sides. Power flows through all of them from a base attachment that can handle up to 30 panels. If you want more than nine starter kit panels, additional services are available in the for \$60 each (about 50 euros/AUS\$80). Setting up it all is a bit of a delicate process. These connector chips don't feel terribly sturdy and they don't snap into place. As I hung everything, I was worried that I didn't use enough included sticky tabs to keep everything snug and safe. Nanoleaf does not provide many guidance as far as best installation practices go; it pretty much just throws you an envelope of these sticky tabs and say: Fun! Everything remained on the wall for the duration of my tests, but I would still appreciate some more specific instructions. However, I was beyond impressed with these panels as soon as I had them up and running. They're a lot of bright (about 100 lumens per panel), shades bright and true, and programmed, color-changing scenes look great (you can make your own in the Nanoleaf app, too). They have made a strong first impression on almost everyone who has seen them, including my colleagues who think that color-changing smart lights are a kind of dumb. Zoom in on the image, modalTemplate:content, setContentOnInit:false'gt; Tyler Lizenby/CNET Colorful smarts With the Aurora panels attached to the wall, your next step is to download the Nanoleaf app to sync them with your phone. It's pretty painless. The base station transmits a Wi-Fi signal when connected. You connect to this signal in your phone's settings and then sync it with your own home network, all of which comply with Apple HomeKit's strict security protocols. Page 2 Your Aurora panels will appear in the app just as you arranged them on the wall. Ry Crist/CNET From there, the app will walk you through its controls. Your panels will appear in the app just as you have them on the wall. You can click on the individual panel to change its brightness or color, or you can choose a palette of colors for the panels to extract from the use of any transitional animation you choose. Color changes can sweep through your installation from panel to panel, disappear in and for the breath effect, or burst out randomly at different points. You can control the speed of all these transition effects, along with small details such as direction and smoothness. Tyler Lizenby/CNET Once you've developed a light template that you like (animated or otherwise), you can save it as a scene. It will join these pre-configured Nanoleaf scenes in the app - you can call any of them with a tap on your phone, or by asking Siri to run it if you're using an iPhone, a la Hey Siri, set the Forest scene. You can also cycle through all of them by clicking on the base attachment (and yes, you can remove those pre-configured Nanoleaf scenes in case there are any you don't want). The Nanoleaf app also lets you see and control others compatible with HomeKit, which is the advantage of standardization that HomeKit offers. This includes color controls for Philips Hue bulbs. Group lamps are like those in the same room as your Aurora panels, and you'll be able to tell Siri Siri Change all colors all at once with the help of a command like, Siri, set the bedroom lights on the green. You can also control the Aurora panels directly from the special Apple Home app for HomeKit. You can't create templates or adjust individual panels, but you can customize the overall color and brightness of your setup, or click to start a scene you've already created in the Nanoleaf app. On top of that, you can anchor these scenes in the HomeKit section of your iPhone's control center for a quick way to switch scenes on the fly. All of this, including Siri controls, worked perfectly throughout my tests. What's missing, I'd like to see even more opportunities for Aurora. The first thing that comes to mind is the music synchronization mode, in which the panels will change colors in rhythm with any tunes you listen to. It doesn't seem like a brain-oriented, party-friendly setup like Aurora, but you won't find it anywhere in the Nanoleaf app. Here's hoping Nanoleaf changes that with the app update in the not too distant future. Another feature I would like to see is the wake-up mode. While you can schedule Aurora panels to turn on and off at certain times, you won't find many options to customize these lighting changes. You can't, for example, plan the panels to gradually disappear within an hour at 6am each day. Enhance ImageA sunrise/sunset wake-up mode is reportedly in the works. Tyler Lizenby/CNET is a trick I use with changing the color of the Lix smart light bulb in my bedside lamp and it makes it a lot easier to get out of bed in the morning. To their credit, Nanoleaf tells me that we can expect to see a sunrise/sunset feature in the app over the coming weeks. The additional interoperability of the platform will help bolster The Aurora case, too. Alexa controls are already on track, with the skill for Amazon's virtual voice assistant due out by the end of the year. The Nanoleaf team also has Google Home on their radar and says they will make integration happen when a new smart speaker is ready. I would also like to see the Aurora Channel on IFTTT. This will allow people to initiate lighting changes using things like GPS location, important notifications, weather and other IFTTT-compatible smart home gadgets. The zoom image of Tyler Lizenby/CNET Verdict Future is bright for these colorful smart panels. There's actually nothing like them. Art lovers could field a day decorating their apartments with them. Parents could use them as the ultimate night light for their children. College football fans could install them to shine school colors in a man's cave or playroom. They also take full advantage of what Apple HomeKit brings connected living space. Aurora is better because of HomeKit - and HomeKit is better because of Aurora, too. It's a kind of smart symbiosis house that's worth buying in. Fun. They take the novelty of color-changing smart light and work further with it than the shade, Lix or anything else ever. I'll admit it. I kind of want them.
